Infrastructure for Distributed Intelligence

LAYER-1 · AI-NATIVE · SERVER-INDEPENDENT

A blockchain built from scratch in Rust — DAG consensus with sub-two-second finality, on-chain AI verification, and zero central points of failure.

Launch Node

Join Testnet

400ms block time · <1.6s finality · 10k+ TPS target · 4 testnet validators

ARCHITECTURE

How it works

Synaptic Consensus

Synaptic Consensus

DAG-based SynBFT with Proof of Useful Work. Blocks reference multiple parents — no single chain bottleneck. 2/3 supermajority finality in 4 rounds. Leader election via VRF, round-paced at 400ms.

Server-Independent

Every component works if all centralized servers go offline. Peer discovery via Kademlia DHT, QUIC transport, gossipsub mesh. No DNS seeds, no bootstrap servers, no single points of failure.

AI Runtime

On-chain verification, off-chain inference. Model registry and compute market at L1.

Dual VM

WASM and EVM side by side. Deploy in Rust, AssemblyScript, or Solidity.

Verkle Trees

Verkle commitments for state proofs — smaller than Merkle, enabling stateless validation.

Pure Rust

One C dependency (blst for BLS12-381). Everything else — redb, BLAKE3, Ed25519 — native Rust.

Chrome Wallet

Browser extension with send, stake, delegate. AES-256-GCM keys, TOTP + WebAuthn 2FA.

WASM Staking

Compile-to-browser staking transactions. Client-side signing with full type safety.

TECHNOLOGY

The Stack

Rust	LANGUAGE
tokio	ASYNC RUNTIME
rust-libp2p	P2P NETWORKING
redb	EMBEDDED STORAGE

revm	EMBEDDED STORAGE
wasmtime + revm	DUAL VM EXECUTION
BLAKE3	HASHING
Ed25519 + BLS12-381	CRYPTOGRAPHY
tract	AI INFERENCE (ONNX)

TOKENOMICS

AZTB

1B Fixed Supply

400M genesis mint (40%). 600M emission pool over ~10 years with 2-year halving and perpetual tail emission.

Validator Rewards

70% of emissions to validators. 15% AI compute providers (PoUW). 10% treasury. 5% insurance fund. 3-12% APY range.

EIP-1559 Fees

Dynamic base fee with 15M gas target per batch. Predictable pricing, MEV-resistant ordering. 21,000 gas for transfers.

Build with us

Run a validator, build on the dual VM, or contribute to the protocol.
